ENERGY MANAGEMENT PLANNING
AND
GREEN HOUSE GAS CALCULATION

PRESENTED BY:

ROBERT S. CERIO
ENERGY RESOURCE MANAGER, BOC, CEM

The History of Energy in the US

The past 100 years

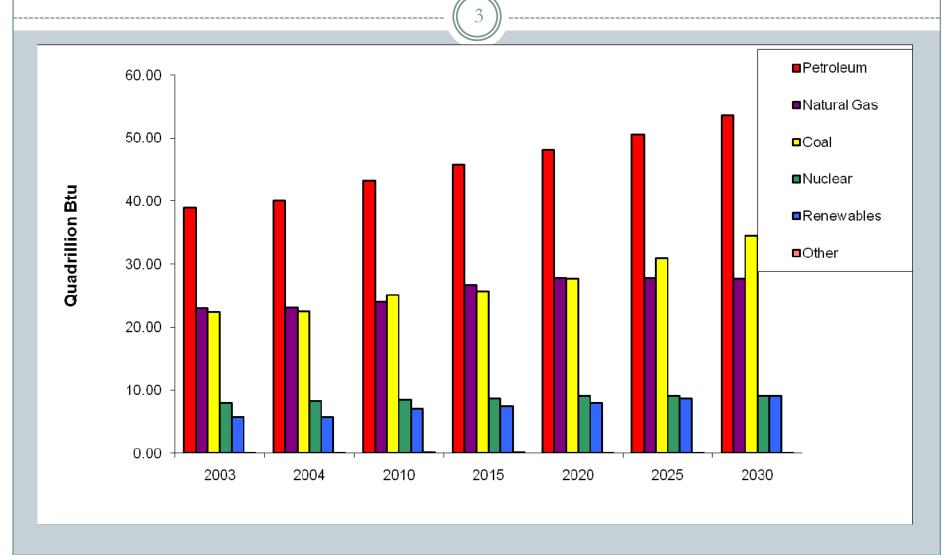

- Muscle
- Wood
- Whale Oil
- Coal
- Petroleum
- Natural Gas
- Renewable Energy Resorces

The Forms of Energy We Use

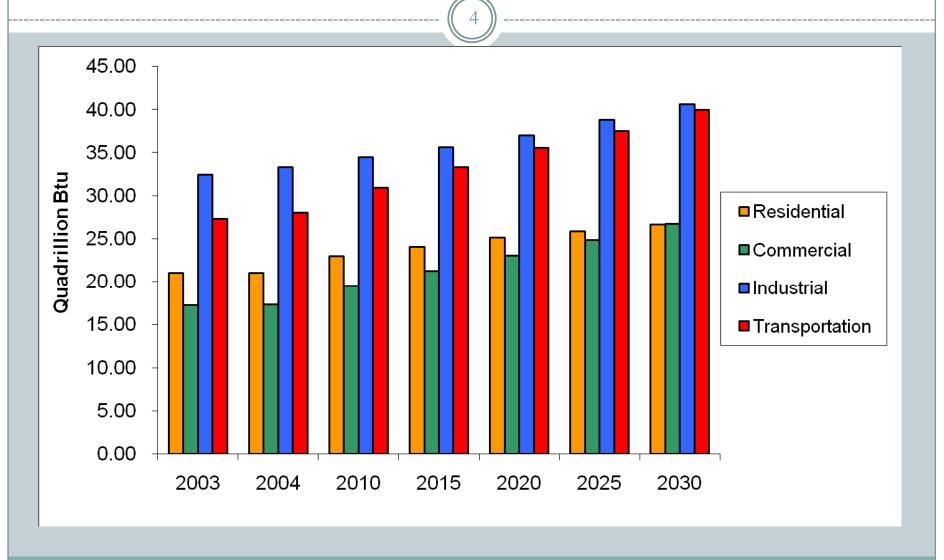

Us Energy Consumption by Resource

Source: Annual Energy Outlook 2006, Energy Information Administration.

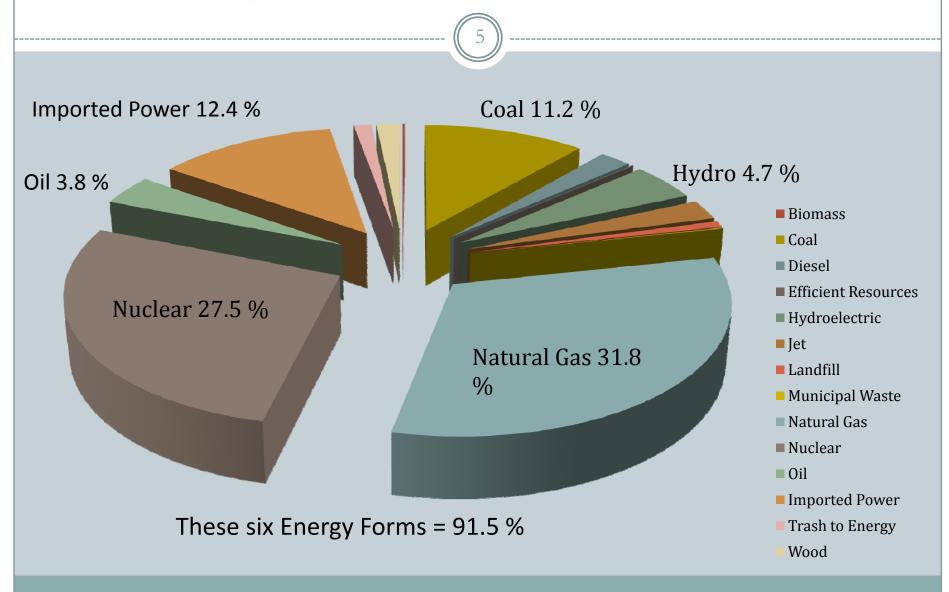

How We Use Our Energy

US Energy Consumption by Sector

Source: Annual Energy Outlook 2006, Energy Information Administration.

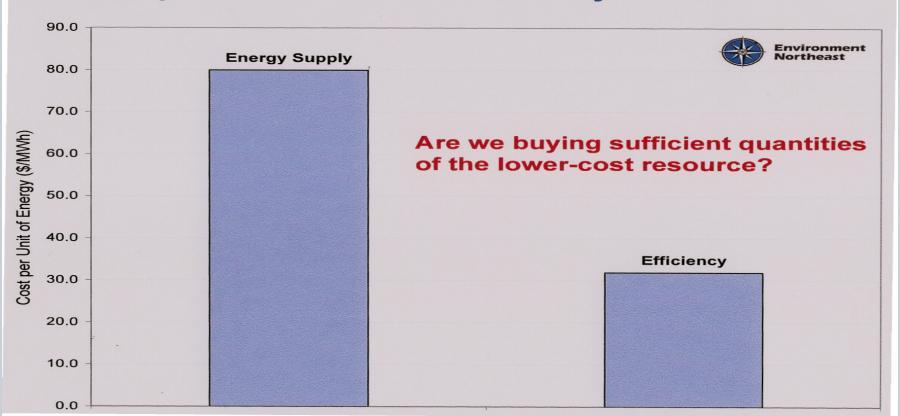

Typical Electric Power Sources

Building New Supply Cost vs. Efficiency

Electric Supply Costs vs. Efficiency Costs

Energy Fundamentals

Common Units of Measurement

- <u>Electricity</u> kilowatt (kW); kilowatt-hour(kWh)
- Natural Gas cubic foot, therm, Dth
- Fuel Oil gallon
- LPG gallon
- Water & Sewer CF, HCF, Kgals.

8

x R-value and U-value:

R-value is the <u>resistance</u> a material has to <u>heat flow</u>.

U-value is a measure of a material's conductivity of heat.

How they relate:

R-value = 1/U-value

Energy Content

- British Thermal Unit, Btu
- 1 Btu = Heat required to raise the temperature of 1 pound of water by 1 degree F

Common thermal unit in most building energy analyses

Energy Thermal Values

10

Natural Gas

- o 1 Cubic Foot = 950 to 1150 Btu
- o 1 CCF = 100 Cubic Feet
- o 1 MCF = 1,000 Cubic Feet
- 1 Therm = 100,000 Btu
- o 1 CCF is approx 1 Therm

Fuel Oil

- Kerosene = 134,000 Btu/Gallon
- O Number 2 = 140,000 Btu/Gallon
- o Number 6 = 152,000 Btu/Gallon

Propane

LPG = 91,600 to 95,000Btu/Gallon

Steam

- o 10 PSIG= 1000 Btu/Lb.
- 100 PSIG = 1100 Btu/Lb.

Coal

- o Lignite = 11,000 Btu/Lb.
- o Bituminous = 14,000 Btu/Lb.

Electricity

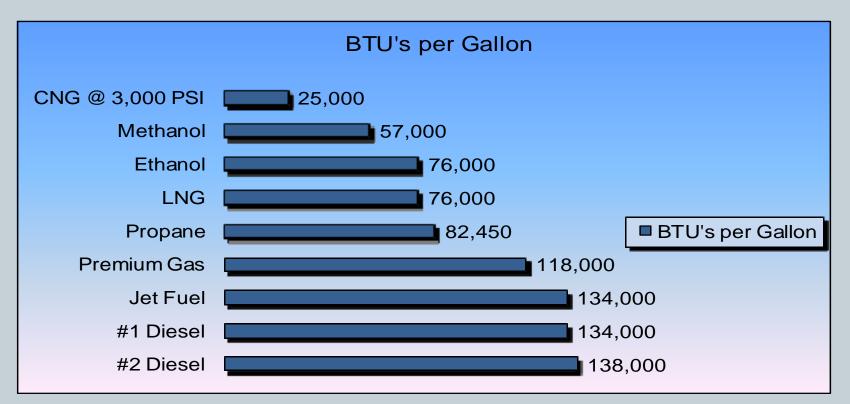

- o 1 kW = 1000 Watts
- o 1 kWh = 3413 Btu

Miscellaneous

- Wood = 8,500 Btu/Lb
- $OU_{235} = 75,000,000 \text{ Btu/gram}$

Relative Energy Potential of Liquid Fuels

- All internal combustion engines operate on the heat produced by the combustion of the fuel.
- The higher the British Thermal Unit "BTU" value per gallon, the less fuel is required to produce the required heat or power.
- Diesel produces 5.52 times as much energy as CNG and is more efficient.

An Energy Management Plan, What is it?

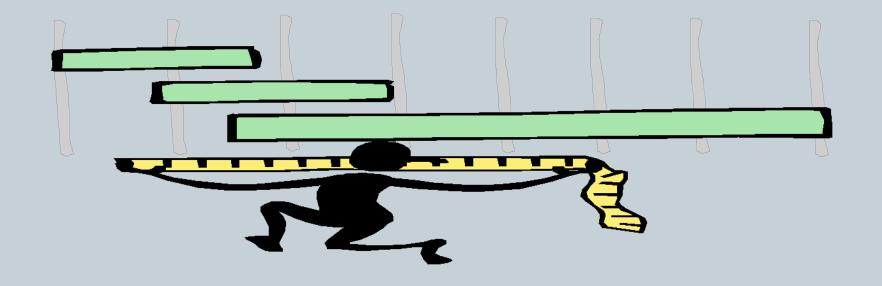

(12)

A must have tool!

- It is a means of measuring and tracking utilities!
- People oriented non retrofit program.
- An educated approach to utility use & procurement
- Achievable by any organization
- The plan typically yields a 10% utility savings
- It is Accountability

"You can't manage what you have not measured."

"The foundation of sound and sustainable energy management plan"

What can you manage and control?

14)

You have no control over cost

You do have control over consumption

Why Do You Need A Plan

It allows you to see were, when & how

- You use energy
- How efficient you are
- Identifies areas of concern
- The basis for repairs
- Utility budget forecasting
- Project Planning & Commissioning
- Grant Opportunities
- Renewable Energy Projects
- Environmental Impact

Areas To Be Addressed

- The Team and Goals
- Initiative, Policy & Guideline
- Accountability Tools
- Reduce Consumption and Increase Savings
- Utility Purchasing
- Retrofit, Construction Planning & Commissioning
- Alternative Energy Resources
- Grant Opportunities
- Educational Component
- Putting it all together
- Environmental Impact

The Team & Goals

17

- Knowledgeable
- Compatible
- Motivated individuals

Shared set of goals

Initiative - Organization Wide

Support from the top down

 Committees, corporate, superintendent, administration, faculty, staff, employees and students

Outside partnerships and support

Partnerships & Support Groups

- State Office of Energy Resources
- State Department of Administration
- State Association of School Committees
- State League of Cities and Towns
- United States Department Of Energy, USDOE
- Energy Smart Schools
- Trade Associations
- State Local Utility Electric & Natural Gas
- Northwest Energy Efficiency Council, NEEC
- Northeast Energy Efficiency Partnerships, NEEP
- Regional ISO
- National Oil Heat Research Alliance, NORA
- National Renewable Energy Laboratory, NREL
- Northeast Sustainable Energy Alliance, NESEA

Accountability

Utility bill Tracking and Bench Marking

- Tracking
 - Cost
 - Consumption
 - Use Trends
 - O Weather
 - History
 - Budget Projection
 - Access, Excel, Energy Cap Pro, Utility Tracker
 - Energy Star-Portfolio Manager or Com Check

www.energystar.gov.

Utility Tracking

21

Track all utilities within a facility

- Electric
- Natural Gas & Propane
- Oil s- Liquid Fuels not a typical utility bill?
- Water
- Sewer
- Compressed Air
- Chilled Water

Understanding Your Utility Bill

22

Identify all of your utilities –
 Perform a building survey and list all utilities & meters

Reading and understanding the bill

Use - consumption

Demand – rate of consumption

Taxes

Energy Fee

SBF & Energy Conservation Funds

Other Charges

Understanding Your Bill

Utility Bills and Rate Structures

Sample Electric Bill

REACTIVE CHARGE

Utility Bills and Rate Structures

- Consumption vs. Demand
- Typical Bills
 - Electric
 - × Local
- Electric Billing Components
- Rate Structures

Understanding how you are billed for energy is fundamental to learning how you can reduce your energy use

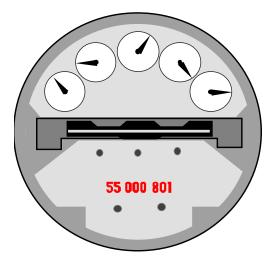

Utility Bills and Rate Structures

Consumption vs. Demand

Energy Consumption

Total electrical energy consumed in a given time period.

- Measured in kilowatt-hours (kWh)
- Energy Demand
 - Rate of electrical energy consumption in a given time period.
 - Measured in kilowatts (kW)

Portfolio Manager Overview Portfolio Manager Overview

Portfolio Manager is an interactive energy management tool that allows you to track and assess energy and water consumption across your entire portfolio of buildings in a secure online environment. Whether you own, manage, or hold properties for investment, Portfolio Manager can help you set investment priorities, identify under-performing buildings, verify efficiency improvements, and receive EPA recognition for superior energy performance.

How can Portfolio Manager help me?

- * Manage Energy and Water Consumption for all Buildings
- * Rate Building Energy Performance
- * Set Investment Priorities
- * Verify and Track Progress of Improvement Projects
- * Gain EPA Recognition
- * Related Tools

Putting it all together

Energy Accountability

How to Audit and Interpret the data

True Savings vs. Cost Avoidance

ROI, NOI and Life Cost Analysis

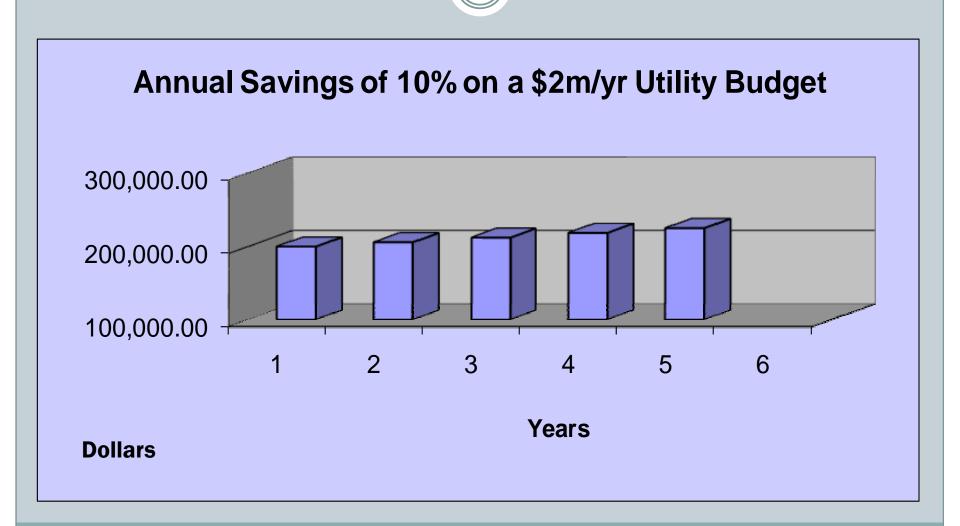

Typical Utility Cost Distribution

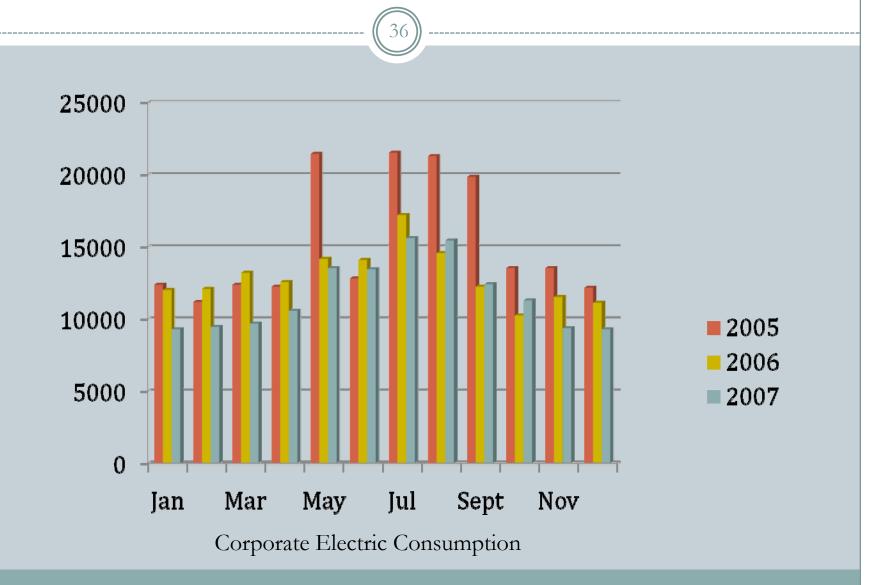

- Typically the cost of Utilities Represents the Second or Third Largest Budget Line Item
- •The Pie Chart Represents a Typical 2 Million Dollar Annual Utility Budget Break Down

Potential Cost Savings Over 5 Years at 10 % = \$1,007,500.00

Monthly Electrical Consumption

Reducing Consumption & Increasing Savings

- Trim building operating conditions & times
- To coincide with occupied & unoccupied times
- Maintain comfort in occupied areas
- Minimize energy waste
- Utility data monitoring
- Aggregate energy purchasing
- New construction oversight build Green
- Grant programs
- Alternative energy resources
- Life cycle cost analysis

38)

- Simple Payback
 - = (Cost Rebate) / Savings /month = ROI
- Total Annual Savings, true savings and cost avoidance
 - = NOI

Energy Terms

Defining Basic Energy Terms

- Conservation: measures taken to reduce using energy consuming systems in order to reduce cost.
- Efficiency: installing systems that use less energy.
- Load Management: controlling your electric or gas demand during on peak periods.
- Demand Side Management: reducing electric or gas loads to help preserve system reliability (and get paid for it).

Small Investment Big Savings

- Measurement & Verification
- Energy Efficiency Measures
- Orientation
- Insulation & Weatherization infiltration,
 R-value, U-value

- 0 & M Procedures
- Filtration
- Lighting & Appliances Energy Star

Energy Conservation

- Steps for Efficient Operation
- Determine Current Performance
 - Evaluate Collected Data
 - Benchmark Building <u>www.energystar.gov</u>
 - Set Goals
- Determine Potential Performance
 - Prioritize Areas of Energy Saving Opportunities
 - Operational Strategies
 - x Low Cost/No Cost
 - Capital Improvement

Energy Conservation Analysis

Life Cycle Financial Analysis: Tale of TWO LIGHT BULBS:

Standard Bulb:

- Short life: 900 hours
- Uses more electricity: 75 W
- Costs \$1 for one bulb

Energy Efficient Bulb:

- Longer life: 10,000 hours
- Uses less electricity: 14 W
- Costs \$4 for one bulb

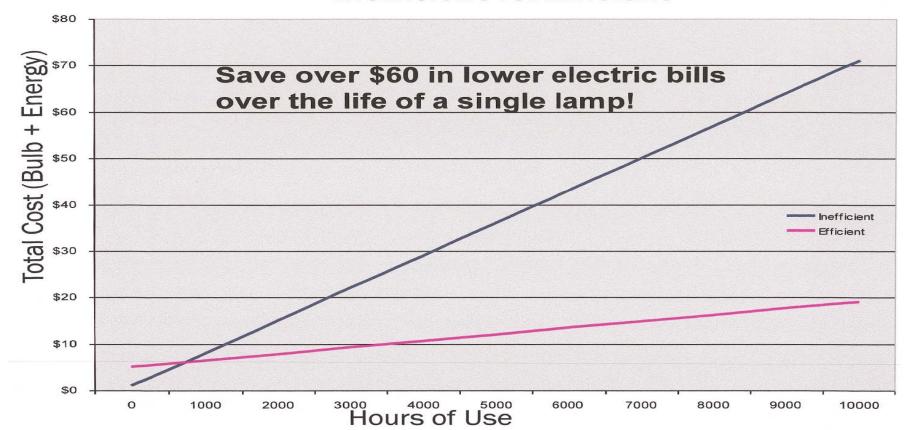

At 15 cents per Kilowatt-hour...

Life Cycle Cost Analysis

Life-Cycle Cost of Two Light Bulbs: Inefficient vs. Efficient

Energy Efficiency Ratings

- One measure of fossil fuel efficiency is Annual Fuel Utilization Efficiency (AFUE)
- Equipment is rated in (SEER)
 Seasonal Energy Efficiency Ratio.
- EER = Rated cooling capacity in Btu
 Electrical demand in Watts
- standing pilot ~ 70% AFUE
- new furnaces must be 78% or higher
- high efficiency furnaces are 90% and greater (ARI reference)

The Greenhouse Effect

Some solar radiation is reflected by the earth and the atmosphere

Some of the infrared radiation passes through the atmosphere. Some is absorbed and re-emitted in all directions by greenhouse gas molecules. The effect of this is to warm the earth's surface and the lower atmosphere.

Most radiation is absorbed by the earth's surface and warms it

Atmosphere

Earth's Surface

Infrared radiation is emitted by the earth's surface

Environmental Impact

The United States Environmental Protection Agency Estimates that every kilowatt-hour (kWh) of electricity use avoided prevents the emission of the following:

- 1.5 pounds of carbon dioxide
- 5.8 grams of sulfur dioxide
- 2.5 grams of nitrogen oxides

A facility that uses 1,000,000 kWh, and saving 10 % per year equals a 10,000 kWh.

These savings are equal to the removal of:

15,000 pounds of carbon dioxide emissions

128 pounds of sulfur dioxide

55 pounds of nitrogen oxide

OR

- 2 automobiles removed from highways annually
- 1 acre of trees being planted

Heating Conversion (Btu's / 3412) = kWh

Emissions Calculators
