What is Nanotechnology

Sugar cube 10,000,000 nm (10 mm) Diameter: 10 mm The study of the controlling of matter on Grain of sand 1,000,000 nm (1 mm) Diameter: 1 mm an atomic and molecular Typical human hair 100,000 nm (0.1 mm, 100 µm) Diameter: 100 µm scale **Engineered nano objects:** 10,000 nm (0.01 mm, 10 µm) at least one dimension Red blood cells Diameter: 5.000 nm 1,000 nm (1 µm) between 1 to 100 nanometers (nm) Typical virus 100 nm (0.1 µm) Diameter: 100 nm Roughly 100,000 times Nanosmaller than the diameter 10 nm (0.01 µm) Carbon nanotubes objects Diameters: 2 - 200 nm of a human hair DNA strand 1 nm (0.001 µm) Diameter: 2 nm

Engineered nanomaterials: enhanced performance compared to their bulk/larger-scale counterparts

- At nano-scale:
 - material properties
 change melting point,
 fluorescence, electrical
 conductivity, and
 chemical reactivity
 - Surface size is larger more material comes into contact with surrounding materials and increases reactivity

Physical-chemical properties: key to performance AND inherent hazard

Can we tune these

R&D and Use – Spanning multiple technology sectors

Today's session

Goal: To understand opportunities and challenges for using nanotechnology/engineered nanomaterials as a toxics use reduction strategy

Presenters:

- Barbara Karn, Sustainable Nanotechnology Organization
- Mark Falinski, Yale University
- Tom Cronin, Cabot

Additional Panelists:

• Mike Ellenbecker (TURI), Angelos Kyrlidis (Cabot)
