## Introductory Chemistry, 3rd Edition Nivaldo Tro

2009, Prentice Hall

## What Is Chemistry?

## Describes the relationships between composition and properties of matter. <br> - Composition

- Types \& number of atoms, structure
- Properties
- Chemical: reactivity, ability to lose/gain electrons
- Physical: state, temperature

## Structure Determines

 Properties- Everything is made of tiny particles called atoms and molecules.
- Chemists study these particles, looking at the kinds, numbers, structure, size which produce varying chemical and physical properties.

Water molecule

##  Phlogiston Theory

- Explanation of combustion in early/mid1700s.
- Combustible substances contained a substance they called phlogiston.
- When a substance burned it released all or some of its phlogiston into the air .
- You can't see it, feel it or measure it. (huh!)

## A Better Theory of Combustion

- Lavoisier proposed an alternative theory of combustion.
- When materials burn, they remove oxygen from the air and combine with it.
- Discovers oxygen, hydrogen
- Literally, rewrites all chemistry textbooks
- Lavoisier's idea starts modern chemistry based on experimentation---measurements

## What Is a Measurement?

- Quantitative observation.
- Comparison to an agreed upon standard.

Every measurement has a number and a unit.

Copyright © 2009 Pearson Prentice Hall, Inc.

## Units

- Units tell the standard quantity to which we are comparing the measured property.
- Without an associated unit, a measurement is without meaning.
- Scientists use a set of standard units for comparing all our measurements.
- So we can easily compare our results.
- Each of the units is defined as precisely as possible.

## Units

- Always write every number with its associated unit.
- Always include units in your calculations.
- You can do the same kind of operations on units as you can with numbers.
- $\mathrm{cm} \times \mathrm{cm}=\mathrm{cm}^{2}$
- $\mathrm{cm}+\mathrm{cm}=2 \mathrm{~cm}$
- $\mathrm{cm} \div \mathrm{cm}=1$
- Using units as a guide to problem solving is called dimensional analysis.

## TURI <br> How important are units?

On 9/23/99, \$125,000,000 Mars Climate Orbiter entered Mars' atmosphere 100 km lower than planned and was destroyed by heat.

$$
\begin{aligned}
& 1 \mathrm{lb} \times 1 \mathrm{~N} \\
& 1 \mathrm{lb}=4.45 \mathrm{~N}
\end{aligned}
$$

"This is going to be the cautionary tale that will be embedded into introduction to the metric system in elementary school, high school, and college science courses till the end of time."

## Problem Solving and Dimensional Analysis Revisited

- Arrange conversion factors so the starting unit cancels.
- Arrange conversion factor so the starting unit is on the bottom of the conversion factor.
- May string conversion factors.
- So we do not need to know every relationship, as long as we can find something else the starting and desired units are related to :

$$
\text { start unit } \times \frac{\text { desiredunit }}{\text { start unit }}=\text { desired unit }
$$

start unit $\times \frac{\text { relatedunit }}{\text { start unit }} \times \frac{\text { desiredunit }}{\text { relatedunit }}=$ desiredunit

## Problem 1: Unit conversion

You just got a deal on a used recycling unit. The specs for the unit give a processing rate of 1.8 liters per minute. The density of the solvent you will recycle is 0.879 grams per cubic centimeter. Your facility operates for two 8 -hour shifts, 7 days a week, 50 weeks a year.
a. How many gallons of solvent can the unit recycle in one day?
b. How many pounds of solvent can be recycled in a year?

## ㅍural $\quad$ More Unit Conversion

 Material Accounting Using Air Monitoring Data- Calculate the concentration of benzene (in $\mathrm{lb} / \mathrm{t}^{3}$ ) given the following:
- Concentration $=4500 \mathrm{ppm}$
- M.W. $=78.1$

## Formulas Describe Compounds

- Elements are represented by a letter symbol.
- A pure compound is composed of atoms of two or more elements.
- The relative quantity of each element is written to the right of the element as a subscript.
- If there is only one atom, the 1 subscript is not written.
- Polyatomic groups are placed in parentheses.
- If more than one.

# Ionic Compounds 

## NaCl formula

## Molecular View of Elements and Compounds

## Some Common Polyatomic Ions

| Name | Formula | Name Formula <br> Acetate $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-}$ <br> Carbonate $\mathrm{CO}_{3}{ }^{2-}$ <br> Hydrogen carbonate <br> (aka bicarbonate) $\mathrm{HCO}_{3}^{-}$ <br> Hydroxide $\mathrm{OH}^{-}$ <br> Nitrate $\mathrm{NO}_{3}^{-}$ <br> Chloriterite $\mathrm{ClO}^{-}$ <br> Nitrite $\mathrm{NO}_{2}^{-}$ <br> Chlorate $\mathrm{ClO}_{2}^{-}$ <br> Chromate $\mathrm{CrO}_{4}{ }^{2-}$ <br> Perchlorate $\mathrm{ClO}_{3}^{-}$ <br> Sulfate $\mathrm{ClO}_{4}^{-}$ <br> Sichromate $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}$ <br> Ammonium $\mathrm{NH}_{4}^{+}$ | Hydrogen sulfate <br> (aka bisulfate) | $\mathrm{HSO}_{4}{ }^{2-}$ |
| :--- | :--- | :--- | :--- | :--- |
| Hydrogen sulfite <br> (aka bisulfite) | $\mathrm{HSO}_{3}^{-}$ |  |  |  |

## Acids

Acids are molecular compounds that form $\mathrm{H}^{+}$when dissolved in water.

- To indicate the compound is dissolved in water, (aq) is written after the formula.
- Not named as acid if not dissolved in water.
- Sour taste.
- Dissolve many metals.
- Zn, Fe, Mg, but not Au, Ag, Pt.
- Formula generally starts with H .
- E.g., $\mathrm{HCl}, \mathrm{H}_{2} \mathrm{SO}_{4}$.

## TURI ㅌ <br> Acids, Continued

- Contain $\mathrm{H}^{+1}$ cation and anion.
- In aqueous solution.
- Binary acids have $\mathrm{H}^{+}$ cation and nonmetal anion.
- Oxyacids have $\mathrm{H}^{+1}$ cation and polyatomic anion.

## Common Acids

| Chemical name | Formula | Old name | Strength |
| :---: | :---: | :---: | :---: |
| Nitric acid | $\mathrm{HNO}_{3}$ | Aqua fortis | Strong |
| Sulfuric acid | $\mathrm{H}_{2} \mathrm{SO}_{4}$ | Vitriolic acid | Strong |
| Hydrochloric acid | HCl | Muriatic acid | Strong |
| Phosphoric acid | $\mathrm{H}_{3} \mathrm{PO}_{4}$ |  | Moderate |
| Chloric acid | $\mathrm{HClO}_{3}$ |  | Moderate |
| Acetic acid | $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ | Vinegar | Weak |
| Hydrofluoric acid | HF |  | Weak |
| Carbonic acid | $\mathrm{H}_{2} \mathrm{CO}_{3}$ | Soda water | Weak |
| Boric acid | $\mathrm{H}_{3} \mathrm{BO}_{3}$ |  | Weak |

## Practice-What Are the Formulas for the Following Acids?, Continued

1. $\mathrm{H}^{+}$with $\mathrm{ClO}_{2}^{-}$
$\mathrm{HClO}_{2}$
2. $\mathrm{H}^{+}$with $\mathrm{PO}_{4}{ }^{3-}$
$\mathrm{H}_{3} \mathrm{PO}_{4}$
3. $\mathrm{H}^{+}$with $\mathrm{SO}_{4}{ }^{2-}$
$\mathrm{H}_{2} \mathrm{SO}_{4}$

## Practice-What Are the Formulas for the Following Bases?,

1. $\mathrm{Na}^{+}$with $\mathrm{OH}^{-}$

NaOH
2. $\mathrm{Ca}^{+2}$ with $\mathrm{OH}^{-}$
$\mathrm{Ca}(\mathrm{OH})_{2}$
3. $\mathrm{Mg}^{+2}$ with $\mathrm{OH}^{-}$
$\mathrm{Mg}(\mathrm{OH})_{2}$

## Practice-Write Formulas for Each of the Following Compounds.

- Hematite-Composed of four oxide ions for every three iron ions.

$$
\mathrm{Fe}_{3} \mathrm{O}_{4}
$$

- Acetone-Each molecule contains six hydrogen atoms, three carbon atoms, and one oxygen atom.
$\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{O}$

## Formula Mass

- The mass of an individual molecule or formula unit.
- Also known as molecular mass or molecular weight.
- Sum of the masses of the atoms in a single molecule or formula unit.
- Whole = Sum of the parts.

Mass of 1 molecule of $\mathrm{H}_{2} \mathrm{O}$
$=2(1.01 \mathrm{amu} \mathrm{H})+16.00 \mathrm{amu} \mathrm{O}=18.02 \mathrm{amu}$.

## Eturil E Practice-Calculate the Formula Mass <br> of $\mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3}$.

## Practice—Calculate the Formula Mass of $\mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3}$

$$
\begin{array}{rll}
\mathrm{Al} & =2 \times & 26.98 \mathrm{amu} \\
\mathrm{~S} & =3 \times & 32.07 \mathrm{amu} \\
\underline{\mathrm{O}} & =\underline{12 \times} \underline{16.00 \mathrm{amu}} \\
\mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3} & = & 342.17 \mathrm{amu}
\end{array}
$$

## Mass Percent as a Conversion Factor

The mass percent tells you the mass of a constituent element in 100 g of the compound.

- The fact that NaCl is $39 \% \mathrm{Na}$ by mass means that 100 g of NaCl contains 39 g Na .
This can be used as a conversion factor.
$-100 \mathrm{~g} \mathrm{NaCl} \equiv 39 \mathrm{~g} \mathrm{Na}$
$\mathrm{g} \mathrm{NaCl} \times \frac{39 \mathrm{~g} \mathrm{Na}}{100 \mathrm{~g} \mathrm{NaCl}}=\mathrm{g} \mathrm{Na} \quad \mathrm{g} \mathrm{Na} \times \frac{100 \mathrm{~g} \mathrm{NaCl}}{39 \mathrm{~g} \mathrm{Na}}=\mathrm{g} \mathrm{NaCl}$

## Chemical Equations

- Short-hand way of describing a reaction.
- Provides information about the reaction.
- Formulas of reactants and products.
- States of reactants and products.
- Relative numbers of reactant and product molecules that are required.
- Can be used to determine masses of reactants used and products that can be made.

# Quantities in Chemical Reactions 

- The amount of every substance used and made in a chemical reaction is related to the amounts of all the other substances in the reaction.
- Law of Conservation of Mass.
- Balancing equations by balancing atoms.
- The study of the numerical relationship between chemical quantities in a chemical reaction is called stoichiometry.

## Balancing Equations

When aluminum metal reacts with air, it produces a white, powdery compound called aluminum oxide.

- Reacting with air means reacting with $\mathrm{O}_{2}$ :

Aluminum(s) + oxygen $(g) \rightarrow$ aluminum oxide(s)

$$
\begin{gathered}
\mathrm{Al}(\mathrm{~s})+\mathrm{O}_{2}(g) \rightarrow \mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s}) \\
4 \mathrm{Al}(\mathrm{~s})+3 \mathrm{O}_{2}(g) \rightarrow 2 \mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})
\end{gathered}
$$

## Counting Atoms by Moles

Because of these formulaic relationships, we need to know the number of atoms or molecules in a given mass of a substance.
Because there are so many atoms, we use a special number, $6.022 \times 10^{23}$ and we call this a mole.
-1 mole $=6.022 \times 10^{23}$ things.

- Like 1 dozen = 12 things.
- Like a kilo $=1000$ or a Google $=1 \times 10^{100}$
- Unlike some of these numbers, a mole has a special significance
- It is called Avogadro's number.

Chemical Packages-Moles
Mole $=$ Number of carbon atoms "in" 12 g of $\mathrm{C}-12$.

- 1 mole protons or 1 mole of neutrons = 1 amu
- C-12 exactly 6 protons and 6 neutrons
-1 mole $\times 1 \mathrm{amu}=1 \mathrm{~g}$.
-1 mole of $\mathrm{C}-12$ (which is 12 amu ) weighs exactly 12 g .
In 12 g of $\mathrm{C}-12$ there are $6.022 \times 10^{23} \mathrm{C}-12$ atoms.

## Relationship Between Moles and Mass

- The mass of one mole of atoms is called the molar mass.
- The molar mass of an element, in grams, is numerically equal to the element's atomic mass in amu.
- The lighter the atom, the less a mole weighs.
- The lighter the atom, the more atoms there are in 1 g .

## Molar Mass of Compounds

The relative weights of molecules is given by atomic weights.
Formula mass = mass of 1 molecule of anything, e.g. $\mathrm{H}_{2} \mathrm{O}=2(1.01 \mathrm{amu} \mathrm{H})+16.00 \mathrm{amu} \mathrm{O}=18.02 \mathrm{amu}$.

- Since 1 mole of $\mathrm{H}_{2} \mathrm{O}$ contains 2 moles of H and 1 mole of O.

$$
\begin{gathered}
\text { Molar mass }=1{\text { mole } \mathrm{H}_{2} \mathrm{O}}^{=2(1.01 \mathrm{~g} \mathrm{H})+16.00 \mathrm{~g} \mathrm{O}=18.02 \mathrm{~g} .}
\end{gathered}
$$

# Making Molecules Mole-to-Mole Conversions 

- The balanced equation is the "recipe" for a chemical reaction.
- The equation $3 \mathrm{H}_{2}(g)+\mathrm{N}_{2}(g) \rightarrow 2 \mathrm{NH}_{3}(g)$ tells us that 3 molecules of $\mathrm{H}_{2}$ react with exactly 1 molecule of $\mathrm{N}_{2}$ and make exactly 2 molecules of $\mathrm{NH}_{3}$ or:
3 molecules $\mathrm{H}_{2}+1$ molecule $\mathrm{N}_{2} \equiv 2$ molecules $\mathrm{NH}_{3}$
- Since we count molecules by moles:

3 moles $\mathrm{H}_{2}+1$ mole $\mathrm{N}_{2} \equiv 2$ moles $\mathrm{NH}_{3}$

## Making Molecules Mass-to-Mass Conversions

- We know there is a relationship between the mass and number of moles of a chemical.

1 mole = Molar Mass in grams.

- The molar mass of the chemicals in the reaction and the balanced chemical equation allow us to convert from the amount of any chemical in the reaction to the amount of any other.

$$
(\mathrm{Pb}=207.2, \mathrm{O}=16.00)
$$

| Given: <br> Find: | $\begin{aligned} & 50.0 \mathrm{~g} \mathrm{~mol} \mathrm{PbO}_{2} \\ & \text { moles } \mathrm{PbO}_{2} \end{aligned}$ |
| :---: | :---: |
| Solution Map: Relationships: |  |
| Solution: | $\begin{aligned} & 50.0 \mathrm{~g}_{\mathrm{PbO}}^{2} \times \end{aligned} \frac{1 \mathrm{~mol}}{239.2 g}, ~=0.20903 \mathrm{~mol}=0.209 \mathrm{~mol} \mathrm{PbO}_{2} .$ |
| Check: | Since the given amount is less than 239.2 g , the moles being $<1$ makes sense. |

## Acid-Base Reactions

- Also called neutralization reactions because the acid and base neutralize each other's properties.
- In the reaction of an acid with a base, the $\mathrm{H}^{+1}$ from the acid combines with the $\mathrm{OH}^{-1}$ from the base to make water.
The cation from the base combines with the anion from the acid to make the salt.

## acid + base $\rightarrow$ salt + water

$$
2 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq}) \rightarrow \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(I)
$$

- The net ionic equation for an acid-base reaction often is:

$$
\mathrm{H}^{+1}(\mathrm{aq})+\mathrm{OH}^{-1}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(I)
$$

- As long as the salt that forms is soluble in water.

## Practice

## Balancing Acid-Base Reactions.

$\mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \rightarrow$
$\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$\mathrm{Al}(\mathrm{OH})_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq}) \rightarrow$
$\mathrm{Al}_{2}\left(\mathrm{SO}_{3}\right)_{3}(\mathrm{~s})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$\mathrm{Ba}(\mathrm{OH})_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \rightarrow$
$\mathrm{BaSO}_{4}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}($ l $)$

# Oxidation-Reduction Reactions 

- We say that the element that loses electrons in the reaction is oxidized.
- And the substance that gains electrons in the reaction is reduced.
- You cannot have one without the other.
- In combustion, the O atoms in $\mathrm{O}_{2}$ are reduced, and the non-O atoms in the other material are oxidized.

## - TURI

## Combustion Reactions

- Reactions in which $\mathrm{O}_{2}(g)$ is a reactant are called combustion reactions.
- Combustion reactions release lots of energy. They are exothermic.
- Combustion reactions are a subclass of oxidation-
 reduction reactions.

$$
2 \mathrm{C}_{8} \mathrm{H}_{18}(g)+25 \mathrm{O}_{2}(g) \rightarrow 16 \mathrm{CO}_{2}(g)+18 \mathrm{H}_{2} \mathrm{O}(g)
$$

## Synthesis Reactions

- Also known as composition or combination reactions.
- Two (or more) reactants combine together to make one product.
- Simpler substances combining together.

$$
\begin{aligned}
& 2 \mathrm{CO}+\mathrm{O}_{2} \rightarrow 2 \mathrm{CO}_{2} \\
& 2 \mathrm{Mg}+\mathrm{O}_{2} \rightarrow 2 \mathrm{MgO} \\
& \mathrm{Hgl}_{2}+2 \mathrm{KI}^{\mathrm{KI}} \mathrm{~K}_{2} \mathrm{Hgl}_{4}
\end{aligned}
$$

## Decomposition Reactions

A large molecule is broken apart into smaller molecules or its elements.

- Caused by addition of energy into the molecule.
- Have only one reactant, make 2 or more products.

$$
\begin{gathered}
2 \mathrm{FeCl}_{3}(\mathrm{~s}) \xrightarrow{\text { elec }} 2 \mathrm{FeCl}_{2}(\mathrm{l})+\mathrm{Cl}_{2}(\mathrm{~g}) \\
2 \mathrm{HgO}(\mathrm{~s}) \xrightarrow{\Delta} 2 \mathrm{Hg}(\mathrm{l})+\mathrm{O}_{2}(\mathrm{~g}) \\
2 \mathrm{O}_{3} \xrightarrow{\mathrm{~h} v} 3 \mathrm{O}_{2}
\end{gathered}
$$

## 

## Decomposition of Water

## $2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \xrightarrow{\text { elec }} 2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})$

## Precipitation Reactions

- Many reactions take place when aqueous solutions of electrolytes are mixed together.
- Often a reaction will take place between the cations and anions in the two solutions that are exchanging.
- If the ion exchange results in the formation of a compound that is insoluble in water, it will come out of solution as a precipitate.

## Problem: Calculating Byproduct from Treatment Records

## Calculate the annual byproduct generation of copper

## Assumptions

Concentration by weight
Volume includes all constituents, not just copper
Production time is 255 days/year

## Problem: Material Accounting Using Air Monitoring Data

Pete's Pretty Good Poisons operates a vent to collect the vapors from a hexane manufacturing process. Measurements show the gas flow rate to be $85 \mathrm{ft}^{3} / \mathrm{hr}$. The average concentration of the hexane is $10,000 \mathrm{ppm}$. The molecular weight of hexane is 86.2 gram/mole. Assume standard temperature and pressure.
(a) Calculate the concentration of hexane in the vent gas in $\mathrm{Ib} / \mathrm{ft}^{3}$.
(b) Calculate the annual emissions into the neighboring residential area in pounds, if the operation ran 12 hours a day for 355 days a year.

## Example: Byproduct from a Known Reaction

Production Unit Boundary

Determine the resulting byproduct if 1500 lb of NaOH is added to: (1) 15,000 pounds of HCl

|  | Quantity added | M.W. |
| :--- | :---: | :---: |
|  | (lb) | (lb/lb-mol) |
| Base $(\mathrm{NaOH})$ | 1500 | 40 |
| Acid $(\mathrm{HCl})$ | 15,000 | 36.5 |

## Problem: Byproduct from a Known Reaction

Production Unit Boundary

Determine the resulting byproduct if 1500 lb of NaOH is added to: (1) 13,000 pounds of $\mathrm{H}_{2} \mathrm{SO}_{4}$

|  | Quantity added | M.W. |
| :--- | :---: | :---: |
|  | (lb) | (Ib/lb-mol) |
| Base $(\mathrm{NaOH})$ | 1500 | 40 |
| Acid $\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)$ | 13,000 | 98.1 |

## Units and Conversions

| Quantity | SI Unit | Abbreviation | Alternate | English Unit | Conversion |  |
